Rarebooksclub.com, United States, 2012. Paperback. Book Condition: New. 246 x 189 mm. Language: English . Brand New Book ***** Print on Demand *****.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1871 Excerpt: $(n+3)-1$ or (n^2+5n+4) tangents; but an n -fold tangent of given position is equivalent to $n(n+1)$ single tangents in its effect upon the determination of the curve. The number of tangents finite in position which determine an w -fold parabola is the difference of these numbers, $2(w-1)$. All the n -fold parabolas, therefore, which touch $2n+1$ fixed lines form a singly infinite series; and it is easy to see that the locus of their foci is a circle. For if we draw an arbitrary line through the circular point t , one curve of the series can be drawn to touch it, and this determines uniquely the tangent from the other point j . These two tangents then, as before, are corresponding rays of The tangential equation to an n -fold parabola is always $ax^2 + by^2 + cz^2 = 0$, where a, b, c are points of contact with the line infinity, and e, f, g points at infinity on tangents from the focus to the curve. From this we may deduce at once a construction analogous to (3), p. 134. In the case of the triple parabola this construction takes the simplified form intercept on X made by $Av, A = y$. $\sqrt{r^2 - 1} \sin(X, Cj) \sin(jL, C3) \sin(X, Ca)$ where A, A are the focal tangents, and $Cu, C2, C3$ the asymptotic directions, P may be determined by making X coincide with Av, A , successively. two homographic...
