Dissociation Among the causes which make vapours deviate from the laws of perfect gases the most important depends upon the dissociation which the molecules undergo as well from rise of temperature as from diminution of pressure. In earlier sections of this book we have several times spoken of this dissociation. Especially in 48-51 has its nature been described and the influence which it exerts on the density of a vapour. In a vapour the molecules are not all of the same size and mass as in a perfect gas. The case often occurs, in consequence of the forces of cohesion, in which two molecules which chance to come near enough to each other join together to form one molecule of double size; and just as frequently the case arises that such a double molecule splits up again into its constituents,...
